## Work Experience

### Data Engineering & AI Associate

September 2025 – July 2026

Kubrick Group

New York, NY

- Engineered and automated a cross-platform metadata sync service integrating Starburst and Collibra using Python and REST APIs, eliminating about 2 hours of manual reconciliation per data product per week.
- Built a FastAPI data quality service with real-time validation checks and business-readable definitions, enabling self-service governance for non-technical stakeholders.
- Partnered with banking stakeholders to translate analytics requirements into API prototypes and preview endpoints, using LLM-assisted prototyping to cut delivery cycles 35-40%.
- Architected a distributed batch processing pipeline on Databricks (PySpark, Delta Lake) for a food delivery analytics initiative, powering KPI and retention dashboards for executive review.

### Data Analyst Intern

June 2024 – August 2024

Chubb

Jersey City, NJ

- Executed exploratory data analysis (EDA) and feature engineering on 2M+ claims records across legacy source systems using Python and pandas, resolving data quality issues upstream of modeling.
- Constructed data preprocessing pipelines restructuring raw transaction logs into time-series formats to support claims-level reserve modeling and segmentation analysis.
- Prototyped k-means segmentation on payment behavior by region, severity, and claim type, presenting 2-3% reserve accuracy gains across \$19B in personal lines to a 20-person data science and actuary team.

## Project Experience

### Steam Storefront Analytics — Databricks & Power BI Analytics Pipeline

- To evaluate Steam storefront health, architected a Databricks medallion pipeline (bronze, silver, gold) across 286 games with a four-table gold star schema for genre-level analysis in Power BI.
- Uncovered that sales rank is a poor proxy for game quality, with several genre top-10 titles scoring below the catalogue average, and recommended shifting storefront promotion to review sentiment instead.

### Expense Tracker — LLM Document Extraction & Analytics Pipeline

- Architected an automated transaction classification pipeline ingesting PDF financial statements via a Groq-hosted LLM, engineering prompt logic to extract structured spend metrics across 4 accounts.
- Designed a 4-table Supabase (PostgreSQL) schema with idempotent upserts and built Next.js/Recharts dashboards to track categorized cash flow across \$5,000+ in transactions.

## Education

### Hamilton College - BA in Economics (Honors) and minor in Statistics (GPA 3.6)

- Honors Senior Thesis: built regression models (OLS, ordered logistic, fixed-effects) on 7,800+ GSS respondents to analyze employment satisfaction, mediation dynamics, and labor statistics.

### London School of Economics - Year-Long Study Abroad in General Course (GPA: 4.0)

## Skills & Certifications

**Technical skills:** Python (pandas, NumPy, FastAPI), SQL, Databricks (PySpark, Delta Lake, Unity Catalog), Starburst Enterprise, Supabase (PostgreSQL), Power BI, Microsoft Azure, Azure DevOps, Docker, Git, Excel

**AI/Machine Learning Frameworks:** TensorFlow, scikit-learn, PyTorch, LLMs, RAG

**Certifications:** Databricks ML Associate, Starburst Deployment Expert, Alteryx Designer Core, Google Analytics Professional Certificate
